

Webauth Authentication Process

Live Server

1. Include webauth.inc in application and optionally set `$webauth_service` and `$webauth_splash`.
2. Webauth.inc redirects the user to webauth to login.
3. After login webauth redirects the user to redirect.php with a ticket in the url.
4. redirect.php executes a curl to webauth with the service and ticket for validation and in response gets an xml return with user information.
5. The user is redirected back to the `$webauth_service` with the information saved in `$_SESSION['webauth']`.
